

Representatives of Nanchong Government Visited the Bombyx Organic Sericulture Development Centre

At the beginning of 2020, Song Chaohua, the secretary of the Nanchong Municipal Committee of Sichuan province, and Wu Qungang, the deputy secretary of the Municipal Party Committee and also the mayor, respectively led the members of the municipal leading group members and the county-level leading cadres to Yilong County to carry out the project training, making an investigation of the local cocoon silk project and visiting the 10,000 acres of core sericulture centre of our company.

In the PFGHL Modern Sericulture Industrial Park, the city secretary Song Chaohua and other leaders visited the silk products of this company. During this period, Song Chaohua highly recognized the contribution that PFGHL Group had made for Nanchong, and pointed out that PFGHL Group is a strong, reputable and prestigious enterprise. The export of foreign exchange products has filled the gaps in Yilong's foreign trade economy.

Especially in the construction of the industrial park, it has reached the level of the European Union countries, with high-efficiency standards, green and organic products, and the pursuit of ecological development, which has overturned the traditional technology of mulberry plantation and sericulture.

The main agricultural technologies and standards that our company applies to organic silkworm breeding centers include planting technology standards, applying renewable agricultural technology, production techniques and management of mulberry field, sericultural technical standards, and sericultural standardized and large-scale production technology management. The application of advanced technologies and strict quality control and other six management measures have upheld the concept of harmonious intergrowth of economic, social and environmental benefits, promoted the advancement of living and ecological environment, and realized comprehensive and sustainable conservation of atmosphere, water, and soil by Bombyx.

The organic sericulture centre being visited this time was signed and implemented by PFGHL Bombyx Organic Agricultural Technology Co., Ltd. in January 2019, and the Bombyx full industry chain project silk factory was officially put into construction on December 19. Within only one year, three important links of construction, completion, and effectiveness were completed, and the development of the entire industrial chain from silkworm breeding, silk reeling and weaving, printing, dyeing and processing, and exporting was realized. Under the leadership of PFGHL Group, the flexible interest linkage mechanism of "the mulberry field construction by

enterprises, silkworm breeding by farmers, and contract after rent" has been conducted. This model is innovative and highly effective, leading the civilians to become rich.

Song Chaohua, the local Communist party secretary, also said that the visit and investigation of the Sericulture Industrial Park further strengthened the confidence and determination for people to create a 100 billion silk and apparel industrial cluster and inspire the confidence and determination to reinvigorate the silk industry in Nanchong. PFGHL will intensively develop and comprehensively utilize the resources of mulberry trees and silkworms, facilitate the transformation of mulberry and silkworm industry from a single industry to a diversified industry through the establishment of the silkworm breeding center and the entire organic industrial chain. PFGHL will also work hard to build the whole industry chain that involves mulberry planting, silkworm breeding, silk reeling and weaving, printing, dyeing and processing, and exporting. PFGHL aims to create an excellent Chinese organic clothing brand and provide consumers with high-quality Chinese garment and textile products all over the world.
